2. LaTeX

This example illustrates how the text above could be encoded in LaTeX, an open source typesetting language that can be interpreted by TeX typesetting programs for producing fixed-layout representations such as PDF. LaTeX is not an XML format, and makes use of “procedural” markup, whose meta-information (starting with the \ character) are instructions for the rendering software on the layout of the text content. As you can see, the actual text contents are preceded by a declaration of several style aspects determining how the text has to be rendered on a page. The text is divided captured as a \document{}, in which all italicised words are indicated as italicised (\textit{}), without difference between the reasons for this typographic emphasis. The footnote is distinguished (\footnote{}), but there is no way of telling the computer that “Goethe” is a proper name.

\documentclass[12pt]{article}
\usepackage{makeidx}
\usepackage{multirow}
\usepackage{multicol}
\usepackage[dvipsnames,svgnames,table]{xcolor}
\usepackage[dvips]{graphicx}
\usepackage{ulem}
\usepackage{hyperref}
\author{the TBE crew}
\title{Statement}
\setlength{\textwidth}{239pt}
\setlength{\voffset}{-72pt}
\setlength{\hoffset}{-72pt}
\setlength{\topmargin}{39pt}
