## TABLE OF CONTENTS

5. Summary.....	1
-----------------	---

## 5. Summary

After this overview of the most current header sections, it is time to put them all together and illustrate how a fairly detailed header for our sample text could look:

```
<teiHeader xmlns="http://www.tei-c.org/ns/1.0">

<refsDecl>
  <p>The paragraphs in the text are numbered with the <att>n</att> attribute. Each
    number consists of four digits; numbering is consecutive throughout the book. For
    example: <val>0203</val> numbers the 203th paragraph throughout the book.</p>
  <p>Each chapter is identified with a formal identification code inside
    the <att>xml:id</att> attribute. Chapters are numbered using arabic numerals.
    The codes are composed by concatenating the identification codes for all ancestor
    text divisions down to the chapter level, with the dot as separation marker. For
    example: <val>I.2.3</val> identifies the third chapter of the second book of the
    first volume.</p>
